– Metallurgy Conglomerate

About:

The Conglomerate is a professionally run; family owned and managed business with over six decades of steadfast growth. The group is technologically robust with diverse manufacturing interests.

Issues:

This group had multiple isolated softwares leading to duplication of databases and additional work. The management wanted to exploit the automation to the fullest and wanted to generate consolidated dashboards for better viewing and decision making.

Methodology:

We understood the softwares functioning in the organisation, their usage, their reporting structures and dashboards. We identified methods of their linkages and standardisation options.

Impact:

- ❖ We standardised the data structures to have a common master that could get linked to Business Intelligence Software.
- ❖ BI got implemented and thus saved a lot of time on generation, validation and reporting of the critical information to the management.
